Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

New cellulose synthase polypeptides and polynucleotides, useful in improving stalk quality or silage, and in increasing concentration of cellulose in the pericarp, hardening the kernel for improved handling ability $\,$

Claim 4; Page 80-85; 88pp; English.

The invention relates to isolated nucleic acids encoding two cellulose synthase proteins from corn, ddpq45 (cesh-3) and cquealy (cesh-9).

Also disclosed are a recombinant expression cassette comprising the polynucleotide (operably linked to a promoter) a host cell comprising the recombinant expression cassette. The nucleic acid is useful in the recombinant expression cassette. The nucleic acid is useful in the improvement of stalk quality for improved stand or sliage, and in the improved and increased concentration of cellulose in the pericarp, hardening the kernel, and thus improving its handling ability. The nucleic acid supplies to be used as probes or amplification primers in the detection, quantification or isolation of gene transcripts, as probes in detecting deficiencies in the level of gene transcripts, as probes in detecting allelic variants, for monitoring up requiration of expression or clanges in enzyme activity in screening assays, for site directed mutagenesis, cell, tissue or plant. The polypeptides may be used in assays for enzyme agonists or antagonists, and as immunogen or antigen to contain antibodies specifically immunoreactive with the protein. The present sequence encodes a corn cellulose synthase of the

The present sequence encodes a maize cellulose synthase polypeptide.
The cellulose synthase can be used for the improvement of stalk quality for improved stand or silage. It also provides an increased concentration of cellulose in the pericarp, hardening the kernel and improving its handling ability. The sequences are used to produce transgenic plants and seeds expressing the cellulose synthase. The polymoclectide is and seeds expressing the cellulose synthase. The polymoclectide is as a probe or primer in the detection quantitation or isolation of gene transcripts. The probability of deficiencies in the level of mRNA in screenings for desired transgenic blant, for detecting mutations in the gene, for monitoring upregulation of expression or changes in enzyme activity in screening assays of compounds, for detecting mutations in the gene, for monitoring upregulation of expression or changes in plant breeding programs. The compounds, for detection of any number of allalic variants of the gene, cor for use as molecular markers in plant breeding programs. The recombinant expression of their encoded polypeptides or for use as immunogens in the preparation and/or screening of antibodies. The proteins can be employed in assays for enzyme agonists or antigonists of enzyme function or for use of immunogens or antigens to obtain
                                                                                                                       New genes which encode maize cellulose synthase polypeptides in plants useful for modulating the expression of cellulose synthase in plants and to produce transgenic plants expressing the novel protein -

The present sequence encodes a maize cellulose synthase polypeptide.
The cellulose synthase can be used for the improvement of stalk quality
for improved stand or silage. It also provides an increased concentration
of cellulose that he pericarp, hardening the kernel and improving its
handling ability. The sequences are used to produce transgenic plants
and seeds expressing the cellulose synthase. The polynucleotide is
used for modulating, preferably increasing, the level of the synthase
in a plant cell. The plants are preferably monocots. The polynucleotide is
solation of gene transcripts. The probes are useful in detecting
deficiencies in the level of mRNA in screening for desired transgenic
plant, for detecting mutations in the gene, for monitoring upregulation
compounds, for detecting mutations in the gene, for monitoring upregulation
of expression or changes in enzyme activity in screening assays of
compounds, for detection any number of allelic variants of the gene,
or for use as molecular markers in plant breeding programs. The
combinant expression of their encoded polypeptides or for use as
immunogens in the preparation and/or screening of antibodies. The
crecombinant expression of their encoded polypeptides or for use as
immunogens in the preparation and/or screening of antibodies. The
crecombinant expression or for use of immunogens or antigens to obtain
continued to the compounds of antibodies or contains to obtain
contains an employed in assays for enzyme agonists or obtain
                                                                                                                                                                                                                                                    New genes which encode maize cellulose synthase polypeptides in plants useful for modulating the expression of cellulose synthase in plants and to produce transgenic plants expressing the novel protein -

The present sequence encodes a maize cellulose synthase polypeptide.
The cellulose synthase can be used for the improvement of stalk quality
for improved stand or silage. It also provides an increased concentration
of cellulose in the pericarp, hardening the kernel and improving its
handling ability. The sequences are used to produce transgenic plants
and seeds expressing the cellulose synthase. The polynucleotide is
used for modulating, preferably increasing, the level of the synthase
in a plant cell. The plants are preferably monocots. The polynucleotide is
stato used as a probe or primer in the detection quantitation or
isolation of gene transcripts. The probes are useful in detecting
deficiencies in the level of mRNA in screenings for desired transgenic
plant, for detecting mutations in the gene, for monitoring upregulation
of expression or changes in enzyme activity in screening assays of
compounds, for detection of any number of allelic variants of the gene,
or for use as molecular markers in plant breeding programs. The
                                                                                                                                                                                                                                                                                                                                                            New genes which encode maize cellulose synthase polypeptides in plants useful for modulating the expression of cellulose synthase in plants and to produce transgenic plants expressing the novel protein -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     immunogens in the preparation and/or screening of antibodies. The proteins can be employed in assays for enzyme agonists or antagonists of enzyme function or for use of immunogens or antigens to obtain antibodies specifically immunoreactive with a protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                or for use as molecular markers in plant breeding programs. The isolated nucleic acids of the present invention can also be used for recombinant expression of their encoded polypeptides or for use as

```
The present sequence encodes a maize cellulose synthase polypeptide.

The cellulose synthase can be used for the improvement of stalk quality
for improved stand or silage. It also provides an increased concentration
of cellulose in the pericarp, hardening the kernel and improving its
handling ability. The sequences are used to produce transgenic plants
and seeds expressing the cellulose synthase. The polymucleotide is
used for modulating, preferably increasing, the level of the synthase
in a plant cell. The plants are preferably monocots. The polymucleotide
is used for modulating, preferably moreasing, the level of the synthase
constant cell. The plants are preferably monocots. The polymucleotide
is also used as a probe or primer in the detection quantitation or
isolation of gene transcripts. The probes are useful in detecting
deficiencies in the level of mRNA in screenings for desired transgenic
compounds, for detections in the gene, for monitoring upregulation
of expression or changes in enzyme activity in screening assays of
compounds, for detection of any number of allelic variants of the gene,
corporated acids of the present invention can also be used for
recombinant expression of their encoded polypeptides or for use as
immunogens in the preparation and/or screening of antibodies. The
proteins can be employed in assays for enzyme agonists or obtain
constant and any and any or enzyme aponists or antagonists
and antibodies specifically immunoreactive with a protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New genes which encode maize cellulose synthase polypeptides in plants useful for modulating the expression of cellulose synthase in plants and to produce transgenic plants expressing the novel protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                              The present sequence is that of a contig of cDNA clones and encodes a portion (see AAYS8840) of wheat cellulose synthase (CS). The cDNA clones were isolated from wheat 7-day seedling leaf and 7-day etiolated seedling root tissue cDNA libraries on the basis of cetiolated seedling root tissue cDNA libraries on the basis of homology to Arabidopsis and cotton CS sequences. The invention relates to isolated nucleic acid fragments encoding plant CS and to CS polypeptides. It also relates to the construction of a chimeric gene encoding all or a portion of the CS, in sense or antisense orientation, where expression of the gene results in altered levels of the CS in transformed host cells. The host cells can be used to screen compounds for their ability to inhibit CS activity. CS nucleic acids are also useful for producing transgenic plants having altered levels of CS, and hence altered levels of fibre. CS may also serve as a target for the development of novel herbicides.
                                                                                                                                                                                                             Nucleic acid fragments encoding cellulose biosynthetic enzyme useful as probes for isolating cDNAs and genes encoding homologous proteins, for producing transgenic plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         2081

Library using probes obtained by PCR with primers (see AAT99632-34)

Library using probes obtained by PCR with primers (see AAT99632-34)

Eased on cellulose synthase RSM1 genomic clone 13H12 (see AAV06563)

and encodes a 1065-pollypeptide (see AAW3819). Claimed nucleic acid
and encodes a 1065-pollypeptide (see AAW3819). Claimed nucleic acid
molecules (see AAV06562-69) coding for claimed pollypeptides (see AAW3816-20) and AAW46202) involved in cellulose biosynthesis can be
used to manipulate the cellulose and/or beta-glucan content of
transgenic plants. Expression of nucleic acids in the sense
crientation increases the level of cellulose and reduces the level
of non-crystalline beta-1.4-glucan and starch, providing plants
with modified strength and/or shape and/or fibre properties, or
having increased resistance to stresses or pests. Antisense,
closuppression molecules can be used to reduce the
cellulose content of a transgenic plant, e.g. to improve
digestibility or to alter carbon partitioning such that increased
carbon is available for growth, rather than deposited as cellulose.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DNA encoding cellulose biosynthetic enzyme - useful for manipulation of cellulose and beta-1,4-glucan
                                                                                                                                                               Cellulose; cellulose synthase; RSW1 gene; beta-1,4-glucan; transgenic plant; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence encodes a maize cellulose synthase polypeptide.
The cellulose synthase can be used for the improvement of stark quality
for improved stand or silage. It also provides an increased concentration
of cellulose in the pericarp, hardening the kernel and improving its
handling ability. The sequences are used to produce transgenic plants
and seeds expressing the cellulose synthase. The polynucleotide is
used for modulating, preferably increasing, the level of the synthase
of in a plant cell. The plants are primer in the detection quantitation or
isolation of gene transcripts. The probes are useful in detecting
deficiencies in the level of mink in screening for desired transgenic
CC plant, for detecting mutations in the gene, for monitoring upregulation
of expression or changes in enzyme activity in screening assays of
compounds, for detection of any number of allelic variants of the gene,
or for use as molecular markers in plant breeding programs. The
confounds caids of the present invention can also be used for
recombinant expression of their encoded polypeptides or for use as
immunogens in the preparation and/or screening of antibodies. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New genes which encode maize cellulose synthase polypeptides in plants useful for modulating the expression of cellulose synthase in plants and to produce transgenic plants expressing the novel protein -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           immunogens in the preparation and/or screening of antibodies. The proteins can be employed in assays for enzyme agonists or antagonists of enzyme function or for use of immunogens or antigens to obtain antibodies specifically immunoreactive with a protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  113 GTGCCAGATCTGCGCCGACGGCCTGGGCACCACGTTGGACGGCGACGTCTTCACCGCCTG 172

The present sequence encodes a maize cellulose synthase polypeptide.
The cellulose synthase can be used for the improvement of stark quality
for improved stand or singer. It also provides an increased concentration
of cellulose in the pericarp, hardening the kernel and improving its
handling ability. The sequences are used to produce transgenic plants
and seeds expressing the cellulose synthase. The polynucleotide is
used for modulating, preferably increasing, the level of the synthase
in a plant cell. The plants are preferably monocots. The polynucleotide
is also used as a probe or primer in the detection quantitation or
isolation of gene transcripts. The probes are useful in detecting
deficiencies in the level of mRNA in screenings for desired transgenic
plant, for detecting mutations in the gene, for monitoring upregulation
of expression or changes in enzyme activity in screening assays of
compounds, for detection of any number of allelic variants of the gene,
cor for use as molecular markers in plant breeding programs. The
isolated nucleic acids of the present invention can also be used for
recombinant expression of their encoded polypeptides or for use as
immunogens in the preparation and/or screening of antibodies. The
proteins can be employed in assays for enzyme agonists or antagonists
of enzyme function or for use of immunogens or antigens to obtain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New genes which encode maize cellulose synthase polypeptides in plants useful for modulating the expression of cellulose synthase in plants and to produce transgenic plants expressing the novel protein .
                Maize; cellulose synthase; stalk quality; stand; silage; cellulose; transgenic plant; plant breeding marker; ss.
                                                                                                                                                   /*tag= a
